All our science in our hands
After tooth extraction:

Spontaneous healing implies alveolar ridge volume loss

What happens with spontaneous healing?

The healing of extraction sockets and the resorption processes that take place after tooth extraction have been investigated thoroughly in recent years.

Clinical studies have shown that:

› The alveolar volume loss after tooth extraction is severe\(^1\)\(^-\)\(^5\)
› Two-thirds of resorption take place within the first three months\(^1\)

Volume loss: clinical implications

Potentially important clinical implications of spontaneous healing compared to Ridge Preservation:

› Poorer maintenance of healthy periimplant soft tissues\(^6\)
› Poorer esthetic outcomes\(^6\)
› 10 times greater need for hard tissue augmentation at implant placement without previous Ridge Preservation\(^7\)

Ridge volume loss after extraction in numbers:

Horizontal loss
- \(49\%\)\(^1\) (after 12 months)
- \(3.8\ \text{mm}\)\(^4\) (after 6 months)

Vertical loss
- from \(-1.2\ \text{mm}\)\(^4\) (after 6 months) to \(-1.5\ \text{mm}\)\(^7\) (after ca. 6 months)

Implant placed without Ridge Preservation\(^8\)

---

Ridge Preservation pays off.

While immediate implant placement does not prevent bone resorption⁹, the treating extraction sockets with Geistlich Biomaterials can largely compensate for bone loss and preserve the contour of the alveolar ridge⁵,¹⁰,¹¹. Volume preservation: clinical evidence

Systematic reviews (high level of clinical evidence) agree that Ridge Preservation is effective in limiting alveolar volume loss.⁶-⁸,¹²-¹⁴

Ridge Preservation with Geistlich Biomaterials can:

› Prevent volume loss and lead to an optimised hard and soft tissue situation irrespective of the chosen time for implantation¹⁵
› Improve the esthetic outcome by preserving the alveolar ridge volume and contour, when the objective of treatment is to place a bridge¹⁶

“We found that alveolar ridge preservation is effective in limiting physiologic ridge reduction as compared with tooth extraction alone.”⁸

Ridge Preservation with Geistlich Biomaterials largely maintains the alveolar ridge volume⁵,¹⁰,¹¹

Ridge Preservation with Geistlich Biomaterials

The use of a biofunctional material such as Geistlich Bio-Oss® is crucial to the long-term successful outcome of extraction socket treatment. After tooth extraction, the slowly resorbing bone matrix Geistlich Bio-Oss® / Geistlich Bio-Oss® Collagen preserves the ridge volume over time and thus makes a major contribution towards the success of Ridge Preservation1-3 or ridge contouring at a later time point (e.g. for early implant placement after spontaneous healing)4,5.

Clinical benefits of Ridge Preservation with Geistlich Bio-Oss®

Clinical studies indicate that Ridge Preservation using Geistlich Bio-Oss® allows for:

› Stable crest heights in sites with thin buccal bone walls6
› Reduced horizontal bone loss in immediate implantation7
› Preserved ridge volume under pontics8

Not all Bone Substitutes are the same – Take a closer look!

In controlled clinical trials:

› Geistlich Bio-Oss® Collagen showed better ridge preservation than fast resorbing ß-TCP1
› Geistlich Bio-Oss® showed better ridge preservation than synthetic hydroxyapatite or gelatine sponge9
› Geistlich Bio-Oss® showed more mineralized tissue in sockets than allografts10

References:

Open-healing with Geistlich Bio-Gide®

Geistlich Bio-Gide® is a highly biofunctional collagen membrane with a bilayer structure: the smooth side prevents soft-tissue ingrowth and serves as a scaffold for the attachment of fibroblasts. The porous side serves as a framework for bone cells and blood vessels. The porous side serves as a framework for bone cells and blood vessels.

› Uneventful wound healing
› High therapy safety with proven open-healing approach

Seal the socket

The collagen matrix of Geistlich Mucograft® Seal specially designed for soft-tissue regeneration is recommended to be used in combination with Geistlich Bio-Oss® Collagen after tooth extraction, when the alveolar buccal walls are preserved.

Clinical data demonstrates that Geistlich Mucograft® Seal:
› May enhance early wound healing
› In combination with Bio-Oss® Collagen significantly reduces the bone loss when compared to spontaneous healing

Conclusion

› + 93 % ridge width maintained with Geistlich Bio-Oss® Collagen and Geistlich Bio-Gide®
› + 83 % ridge width maintained with Geistlich Bio-Oss® Collagen and Geistlich Mucograft® Seal

In the following pages you will find a collection of documented clinical cases showing a great variety of treatment concepts with different Biomaterials.
Immediate implant placement with minor bony defect

“Geistlich Bio-Oss® Collagen is effective to offset the natural alveolar contraction that naturally occurs following tooth extraction, that could hamper aesthetics and lead to soft tissue instability.”

Objectives

› Replace a hopeless central incisor with a horizontal fracture of the tooth root and buccal bone fenestration.

Conclusions

› Ridge Preservation techniques are effective in minimizing volume loss and achieving a nice emergence profile 6 months after simultaneous grafting and immediate implant placement.
Initial examination shows a probing depth of 9.0 mm suggesting a root fracture. A CBCT identifies an extensive loss of buccal bone wall.

Analyzation of 4 parameters before deciding for a therapy: residual bone, gingival margins, buccal bone wall and gingival biotype.

Examination of the residual bone by taking a CBCT scan: residual bone is excellent to anchor an immediate implant in a ideal 3D position.

Careful and gentle minimally invasive extraction of the tooth to no further compromise the socket damage.

Identification and definition of the U-shaped defect in depth and width by gentle pressing the periodontal probe over the area of the defect.

Immediate implant placement with a surgical GIDE.

Connective tissue graft was harvested, positioned and sutured to cover the recession defects in position 11 and 21.

Geistlich Bio-Gide® Shape is placed below the connective tissue graft and the periosteum.

Geistlich Bio-Oss® Collagen is placed to fill the gap between the implant and buccal bone wall. The membrane should exceed at least 3mm apical and lateral of the defect.

Occlusal view of the ETR (esthetic tissue reconstruction) supporting the tissues while maintaining the necessary bone volume.

The provisional crown was placed immediately after grafting and implant placement. Complementary sutures of coronal traction of the flap were performed in each interproximal area supported at the contact point.

Replacement of the temporary crown 6 months after surgery. Final prosthesis by Dr. Victor Clavijo

### Objectives

- Immediate implant placement in order to reduce the treatment period for the patient
- Preservation of the vestibular bone volume
- Preservation of the gingival architecture

### Conclusions

- The technique minimises the treatment time
- The treatment maintains the archetype of the soft and hard tissues

### Before extraction

![Before extraction image]

### 1 year after extraction

![1 year after extraction image]
The patient presents with a fractured central incisor. The biotype is rather thin with scalloped marginal gingiva.

The gap from implant to the buccal bone is filled with Geistlich Bio-Oss®. A connective tissue graft is placed between the mucosa and the buccal bone.

The implant (NobelActive™) is positioned optimally, with a more palatal vestibular orientation. The provisional abutment is placed.

An ideal emergence profile is effected. The provisional crown allows maintenance of the papillae.

The provisional prosthesis is placed and left out of occlusion.

Clinical situation 8 days post-operative. The healing occurs uneventfully.

Situation 4 months after extraction, prior to finalising the prosthetic restoration.

The natural profile of the soft tissues has been preserved.

An individual impression post is created for precise transfer of the emergence profile to the lab.

The final crown is made directly over a zirconia abutment (Procera®).

Vestibular view of the final restoration 12 months after tooth extraction. Note the perfect alignment of the neck of the teeth and ideal position of the papillae in relation to the contact points.

Material selection

Geistlich Bio-Oss® small granules (0.25-1 mm)
Early implant placement with GBR after 8 weeks of spontaneous healing

Prof. Daniel Buser & Prof. Urs Belser | Berne, Switzerland

Objectives

› Pleasing esthetic outcome
› Long-term stable bone and soft-tissue situation in the esthetic region

Conclusions

› The low substitution rate of Geistlich Bio-Oss® helps to maintain the volume of the alveolar ridge over time, which is crucial for the long-term esthetic outcome.
› Minimal marginal bone loss and low risk of mucosal recession.

Before extraction.

7.5 years after implant therapy.
1 Clinical findings in the initial examination. The patient exhibits a high smile line and reports an accident several years ago, which affected tooth 11.

2 The extraction socket and the soft tissue are allowed to heal for 4–8 weeks after debridement of the inflammatory tissue.

3 Within 4–8 weeks of soft tissue healing, no reduction is visible in the crest width in the approximal region of the socket.

4 Special attention is payed to correct prosthetic positioning of the implant in all three dimensions with good primary stability.

5 The defect is covered with locally harvested autologous bone chips to promote new bone formation as quickly as possible.

6 The bone volume is further optimised by local augmentation using Geistlich Bio-Oss® granules.

7 Geistlich Bio-Gide® is applied in two layers to act as a temporary barrier and as a stabiliser for the graft.

8 Following the release of the flap by means of mucoperiosteal incisions, a tension-free primary wound closure is achieved. Provisional implant prosthesis starts after 8 weeks.

9 The 7.5-year follow-up shows a stable esthetic outcome.

10 X-rays a) at 1 year: implant optimally integrated in the bone; b) at 4 years: absolutely stable peri-implant bony conditions.

11 CBCT findings at 7.5 years a) section showing a completely intact facial wall; b) 3-dimensionally correctly placed implant.

12 The long-term esthetic result is excellent.

**Material selection**

- Geistlich Bio-Oss® small granules (0.25–1 mm)
- Geistlich Bio-Gide® (25 × 25 mm)
### Spontaneous healing for cantilever implant bridge

“Early implantation with simultaneous contour augmentation is predictable in challenging cases in the esthetic zone.”

#### Objectives
- Prosthetic restoration of 2 side-by-side sockets in the anterior area
- Ridge Preservation for cantilever implant bridge

#### Conclusions
- Early implant placement is suitable for 2 side-by-side sockets
- The collapse of the tissues during the 6-week healing period can be compensated with a GBR contouring with Geistlich Bio-Oss® and Geistlich Bio-Gide®.

---

Before extraction.

5.5 months after extraction.
Initial situation before extraction of 21 and 22.

Clinical close-up of the pre-operative site prior to extraction of the teeth.

Radiographic findings of the pre-operative site. Note the apical bone resorption at 22 and internal root resorption of tooth 21.

Scheme of the 2 side-by-side sockets.

Teeth 21 and 22 are extracted and left heal spontaneously under a provisional restoration.

Buccal view after 6 weeks of spontaneous healing, immediately before re-entry. Note the flattening of the ridge anticipating a horizontal defect.

Occlusal view 6 weeks post-extraction. The soft tissues are healed.

After flap elevation and implant placement, the resorption of the alveolar bone is compensated with Geistlich Bio-Oss®.

Geistlich Bio-Gide® is placed over the treated area to stabilise the graft and to obtain the desired contour augmentation.

Healing of the treated site 18 weeks post-extraction.

Occusal view after 18 weeks. Transmucosal healing took place with conditioning of the soft tissues with the provisional crown. The recession on tooth 23 has been covered with a coronally advanced flap and a connective tissue graft.

X-ray of the final prosthetic restoration.

Schematic representation of the cantilever implant bridge.

Final situation with the cantilever implant bridge in place 5.5 months after tooth extraction.

Material selection

Geistlich Bio-Oss® small granules (0.25–1 mm)
Geistlich Bio-Gide® (25 × 25 mm)
Early implant placement in extraction socket with preserved bone walls

Dr. Raffaele Cavalcanti | Bari, Italy

Objectives
- Compensation of the bone resorption through Ridge Preservation
- Provide the patient with a final restoration in a relatively short time period of time

Conclusions
- Almost complete maintenance of the ridge volume is achieved
- After 8–10 weeks, the soft tissue has a quality and maturity that is adequate for early implant placement.

Material selection

Geistlich Bio-Oss® Collagen (100 mg)
Geistlich Mucograft® Seal (8 mm diameter)
Objectives

- Preservation of hard and soft-tissue volume after tooth extraction.
- Late implant placement, as it is an extremely reliable procedure, which has been proven repeatedly in the international literature.

Conclusions

- Geistlich Bio-Oss® Collagen and Geistlich Mucograft® Seal preserve the ridge for optimal implant placement 5 months post-op.
- At the central incisor, the buccal soft-tissue thickness is optimised with a connective tissue graft.
Tooth 21 is scheduled for extraction due to periodontal problems.

Meticulous curettage of the socket after atraumatic flapless extraction.

Filling of the extraction socket with Geistlich Bio-Oss® Collagen up to the palatal bone.

Geistlich Mucograft® Seal in place: the spongy structure faces towards the bone substitute.

Geistlich Mucograft® Seal is sutured with single interrupted sutures allowing optimal adaptation between the borders of the soft tissues and the collagen matrix.

Wound healing at 2 weeks: good healing of the soft tissues with a beautiful pink colour.

Wound healing at 3 months: complete closure of the socket with mature soft tissues.

Five months after extraction: good maintenance of the alveolar bone volume.

Implant placement to replace tooth 21 without additional GBR.

Connective tissue graft harvested at the left palate.

The connective tissue graft is placed at the buccal site and the flap is closed with suspension sutures and single interrupted sutures (monofilament 6/0).

a) X-ray shows the osseointegrated implant 3 months after implant placement. b) Follow-up 28 months after extraction.

### Objectives
- Delayed implant placement 4 months after extraction
- Minimally invasive treatment of the socket

### Conclusions
- Good/mature/solid bone obtained 4 months after treatment
- Fast and scar-free soft-tissue regeneration
- Optimal clinical and esthetic result for the patient

---

“Soft and hard tissues are well preserved without any scarring on the buccal or occlusal aspect.”

---

**Ridge Preservation in extraction socket with preserved buccal bone**

Before extraction. 2 years after extraction.

* Intact extraction socket, with a minor bony defect up to 50% of the buccal bone wall
Material selection

Geistlich Bio-Oss® Collagen (100 mg)
Geistlich Mucograft® Seal (8 mm diameter)
Ridge Preservation in defect extraction sockets

“Whenever possible we prefer to preserve rather than to rebuild the bone later, specially in the front teeth.”

Objectives

› Maintain hard and soft-tissue contour in esthetically demanding region
› Late implant placement in single tooth gap

Conclusions

› Severe ridge resorption was prevented with Geistlich Biomaterials
› A long-term pleasant outcome was achieved with additional contouring with Geistlich Biomaterials and a connective tissue graft at implant placement

Before extraction. 11 months after extraction.
1 Initial situation before removal of tooth 21.
2 Inspection of the extraction socket with the periodontal probe shows a buccal bony defect.
3 Geistlich Bio-Gide® is placed buccally on the inner alveolar wall, slightly protruding the crestal bone. Geistlich Bio-Oss® Collagen fills the socket up to the crestal bone level.
4 Geistlich Bio-Oss® (small granules) are packed on top of Geistlich Bio-Oss® Collagen up to soft-tissue level.
5 The collagen membrane is folded over the filled socket, adapted under the palatinal sulcus, fixed with vertical mattress sutures and heals by secondary intention.
6 Uneventful healing situation 3 days post-extraction.
7 Clinical situation 1 week after tooth extraction.
8 Situation after site-conditioning of the soft tissues 4 months post-extraction.
9 Flap elevation and implant placement reveal a fenestration 4 months after tooth extraction.
10 The ridge is contoured with a GBR (Geistlich Bio-Oss® and Geistlich Bio-Gide®) and a connective tissue graft on the buccal-crestal area.
11 The flap is closed over the graft.
12 Loading of the implant with the final restoration 7 months after implant placement (11 months after extraction).

Material selection

- Geistlich Bio-Oss® small granules (0.25–1 mm)
- Geistlich Bio-Oss® Collagen(100 mg)
- Geistlich Bio-Gide® (25 x 25 mm)
**Extraction socket treatment options**

The appropriate type of treatment for the management of extraction sockets is derived from a coherent evaluation of the esthetic risk factors. In addition to the time of implantation, the attending dentist needs to make a decision regarding regenerative measures directly after tooth extraction. Various procedures are recommended:

**Timeline**

1. **immediately**¹
   - Spontaneous healing
   - Ridge Preservation

2. **early**
   - (4–8 weeks¹ or 8–10 weeks²)
   - Ridge Preservation

3. **delayed**¹
   - (12–16 weeks)
   - Ridge Preservation

4. **late**¹
   - ( > 16 weeks)
   - Ridge Preservation

---

* The definition of an intact extraction socket varies among experts and includes buccal bone defects of 0 to 50%.

**Objectives**

- Preservation of hard and soft-tissue volume after extraction in the anterior region for late implant placement.
- Prevention of extensive guided bone regeneration procedures at implant placement.

**Conclusions**

- Volume of hard and soft tissue can be preserved better with Geistlich Bio-Oss® Collagen and Geistlich Mucograft® Seal than with spontaneous healing.
- A minimally invasive GBR is performed to contour the ridge at implant placement.

---

* Intact extraction socket, with a minor bony defect up to 50% of the buccal bone wall
Extraction of tooth 21 due to a trauma with concomitant external resorptions. Care was taken in preserving the alveolar bone.

Occlusal view of the socket after tooth extraction. No flaps are raised around the affected area. A slight buccal bone defect was observed.

The socket is gently curetted for removal of granulation tissue. Subsequently, the wound margins were de-epithelialised with a diamond in a counter-piece with water cooling.

Filling of the extraction socket with Geistlich Bio-Oss® Collagen to the level of the palatal bone.

Geistlich Mucograft® is applied dry and adapts perfectly to the wound margins.

Suturing of the Geistlich Mucograft® with 6-0 single interrupted sutures.

The tissues are left to heal beneath the provisional, taking care not to apply pressure to the biomaterials.

Situation 7.5 months after extraction revealing nice soft-tissue situation with a slight dip at the buccal aspect.

Flap elevation shows the healed bony situation 7.5 months after Ridge Preservation.

Implant placement in fully mature bone. A small GBR for contouring is performed.

Excellent emergence profile after 10 months.

Situation with the final restoration 10 months after tooth extraction.

Material selection

Geistlich Bio-Oss® Collagen (100 mg)
Geistlich Mucograft® (15 x 20 mm punch 8 mm diameter)
## Ridge Preservation in the posterior region for late implantation

“Geistlich Bio-Oss® and Geistlich Mucograft® Seal enable a flapless and effective Ridge Preservation.”

### Objectives
- Preservation of the ridge contour with minimal invasion
- Late implant placement

### Conclusions
- Geistlich Bio-Oss® and Geistlich Mucograft® Seal enable a flapless and effective Ridge Preservation
- Hard and soft tissues are optimal for implant placement 6 months after Ridge Preservation procedure

Before extraction. 6 months after extraction.
Clinical appearance before treatment (buccal).

Clinical appearance before treatment (occlusal).

Situation after tooth extraction.

The socket is grafted with Geistlich Bio-Oss® up to the bone level.

Geistlich Mucograft® Seal is sutured with 8 single interrupted sutures.

Healing of the soft tissues 1 week after tooth extraction.

Clinical post-op appearance 8 weeks after extraction.

Situation 6 months after tooth extraction and before implant placement.

Minimal flap elevation reveals optimal bony and soft-tissue situation for correct implant placement.

Closure of the flap for submerged healing.

Occlusal clinical view 3 weeks after submerged implant placement (6.5 months after extraction).

Buccal clinical view 6.5 months after extraction.

Material selection

**Objectives**

- Replace a hopeless central incisor with a vertical fracture of the tooth root and buccal bone fenestration. The vestibulum already showed a fistula.

**Conclusions**

- Ridge Preservation techniques are effective in minimising volume loss.

Before extraction. 7 years after extraction.
Initial situation of the fractured tooth with the vestibulum showing a fistula.

Extraction of the fractured tooth root.

Examination of the extraction socket.

Exposure of the fenestration by an apical cut to avoid a resorption of the vestibular bone and resorption of the papilla. If a flap would be applied, the blood supply to the remaining thin vestibular bone would be interrupted and certainly resorb. Subsequent removal of the granulation tissue from the apical area under sight and without touching the marginal gingiva.

Insertion of Geistlich Bio-Gide® into the extraction socket and filling with Geistlich Bio-Oss® granules.

Geistlich Bio-Gide® was folded palatally over the socket and marginal-palatal sutured to protect the vestibular alveolar ridge and avoid tension. The apical incision was sutured as well.

6 months after removing the provisional, a well-preserved alveolar ridge with well-preserved papillae appeared.

Flapless implantation with a tissue level implant. A provisional was fixed adhesively to the adjacent teeth.

Another 6 months later, final restoration with a porcelain-fused-to-metal crown on an intra-oral solid abutment, following the rules of Biological Width Protocol (Dr. Taffet).

10 months follow-up with final restoration in place.

Stable soft-tissue situation 3 years post-surgery.

7 years post-surgery shows a stable esthetic result over time.

Material selection

Objectives

- Prevent tissue collapse in the posterior area due to absence of the buccal bone wall.
- Avoid a possible sinus elevation.

Conclusions

- Ridge preservation with Geistlich Biomaterials preserved the alveolar ridge contour.
- A minimally invasive procedure provided enough ridge width for adequate implant placement and esthetic outcome.
Compromised upper molar due to longitudinal tooth fracture.

CBCT upper molar before extraction. Note the absence of the buccal bone wall.

Socket after tooth extraction.

Buccal bone wall replaced by Geistlich Bio-Gide®.

Filling with Geistlich Bio-Oss® (small granules 0.25–1 mm).

Geistlich Bio-Gide® is sutured with a cross-suture.

Clinical situation after 6 months of healing.

CBCT 6 months post-extraction before implant placement.

Flapless implant installation procedure 6 months after tooth extraction.

Implant in place 6 months after tooth extraction and Ridge Preservation procedure.

CBCT immediately after implant placement.

Abutment connection.

Objectives

› Reconstruct alveolar bone with severe vertical loss from chronic periodontitis at the lower left second molar
› Investigate the clinical and histological result by using Geistlich Combi-Kit Collagen after tooth extraction.

Conclusions

› The defect was completely filled with newly-formed hard tissue after 6 months
› Histomorphometric analysis revealed 45% of the hard tissue area including bone substitute material and 28% of the soft tissue area.

Before extraction. 9 months after extraction.
Radiological status prior to extraction. Initial smile.

Starting situation.

Status following atraumatic extraction of tooth 17.

A flap is raised.

Filling of the extraction socket up to the level of the crestal bone level using Geistlich Bio-Oss® Collagen.

Insertion of the Geistlich Bio-Gide® membrane over the defect.

Closure of the extraction socket with a mattress suture.

Situation 6 months post-op.

Newly formed hard tissue. Geistlich Bio-Oss® Collagen is not obvious.

One stage protocol with healing abutment.

Provisional prosthesis.

Radiological view after implantation.

**Objectives**

- Delayed implant placement to restore tooth 34
- Minimally invasive procedure without mobilization of the flap to cover the graft; healing by secondary intention (open healing).

**Conclusions**

- Geistlich Bio-Gide® Shape in combination with Geistlich Bio-Oss® Collagen preserved largely the ridge dimensions after tooth extraction.
- Implant can be placed without need of a second bone grafting at time of implant placement.

**“Geistlich Bio-Gide® Shape is a really user-friendly product that can easily be used in the management of post-extraction sites for ridge preservation.”**

Dr. Daniele Cardaropoli | Torino, Italy

**Before extraction.**

**12 months after extraction.**
1 Pre-surgery occlusal view.

2 Raising of a flap was necessary to remove the tooth because of the internal root resorption (34).

3 Empty alveolus with a thin and defective bone wall.

4 Geistlich Bio-Gide® Shape a) with the smooth side (outwards) and b) the rough side (inwards).

5 Geistlich Bio-Gide® Shape in place, applied dry within the alveolus.

6 After application of the collagen membrane, the alveolus is filled with Geistlich Bio-Oss® Collagen.

7 Suturing with 3 single knots each on buccal and lingual site to fix the bone graft and one additional suturing to maintain the papillae.

8 Clinical situation 1 week after extraction. Geistlich Bio-Gide® was left exposed and the wound heals uneventfully by secondary intention.

9 Clinical situation immediately after suture removal 2 weeks after extraction.

10 Follow-up 4 weeks after tooth extraction.

11 Ridge preservation provided an optimal ridge width for implant placement without re-grafting 5 months post-extraction.

12 Soft-tissue conditioning 9 months after tooth extraction.

Material selection

Objectives

› Maintain alveolar contour, which is a combination of hard and soft tissue under pontics.

Conclusions

› Geistlich Mucograft® prevents particulate graft from leaking out of the socket before being incorporated into healed tissue.
› Alveolar contour was largely maintained with Geistlich Mucograft® and Geistlich Bio-Oss®.

Before extraction.

11 months after extraction.
Radiographic findings prior to implant placement in teeth 12 and 22.

Clinical initial situation prior to implant placement in teeth 12 and 22.

Maxillary central incisors scheduled for extraction due to recurrent endodontic infections 2 months after implant placement in lateral incisors.

Extraction sockets grafted with Geistlich Bio-Oss®. The bone substitute fills the socket up to slightly above the bone crest.

Geistlich Mucograft® is placed over the occlusal surfaces as a socket seal.

Provisional restoration.

Provisional restoration contoured to maintain Geistlich Mucograft® in place, taking care not to compress the grafted site.

Vascularisation and integration of Geistlich Mucograft® after two weeks.

Clinical situation 1 month post-op.

Occlusal view at 9 months with the final restoration (11 months after teeth extraction).

Buccal view at 9 months with the final restoration (11 months after teeth extraction).

Radiograph showing integration of the graft material in the sockets. Final restoration in place.

Material selection

Objectives

› Augment the bone tissue and preserve the soft tissue for implantation at a later point in time.
› The goal is to attain an appealing esthetic result for the mid-term temporary reconstruction.

Conclusions

› Minimal horizontal bone loss and widening of the keratinized gingiva thanks to Ridge Preservation with Geistlich Bio-Oss® Collagen and Geistlich Bio-Gide® Shape.
› On the regenerated side 3 months postoperative the red white esthetics are just as good as on the natural tooth side.

Pre-extraction view of region 22.

3 months follow-up.
Initial situation of tooth 22.

Atraumatic removal of tooth 22 with Benex® extraction kit.

Inspection of the extraction socket shows a buccal bone defect.

The preformed Geistlich Bio-Gide® Shape reduces the preparation time for cutting to size.

Geistlich Bio-Gide® Shape is placed buccally on the inner socket wall.

Geistlich Bio-Gide® Shape protrudes slightly above the crestal bone.

Geistlich Bio-Oss® Collagen fills the socket up to the crestal bone height. It can be beneficial to divide up the Geistlich Bio-Oss® Collagen and then introduce it into the socket portion by portion.

Geistlich Bio-Gide® Shape covers the bone replacement material and is pushed under the soft tissue at the edge of the socket. Fixation of the augmentation without stress using cross suture. Single sutures are possible.

Ten days follow-up with good wound healing by secondary intention.

Good pink esthetics at three months follow-up.

Minimal horizontal bone loss.

Restoration with a mid-term temporary adhesive bridge.

Material selection

Geistlich Bio-Oss® Collagen (100 mg)

Geistlich Bio-Gide® Shape (14 mm × 24 mm)
Technical Guidelines

**Geistlich Bio-Oss® Collagen**
- Can be applied both dry, as well as moistened with saline solution or blood.
- Can be cut to size and carefully introduced into the socket with a forceps.
- Can be packed into the socket with a bone graft plugger (or similar), taking care not to compress it too strongly.

**Geistlich Bio-Gide® | Geistlich Bio-Gide® Shape**
- Should be cut dry.
- Should be applied dry with the smooth side facing the oral cavity.
- Can be applied inside the alveolus on the defect area or alternatively be inserted between the periosteum and the soft tissue.
- The wings of Geistlich Bio-Gide® Shape can be tucked under the sulcus.
- Can be left for open healing or can be submerged by tension-free closure of the extraction socket
- Has to be used with an alveolar filling material (e.g. Geistlich Bio-Oss® Collagen).

**Geistlich Mucograft® Seal**
- Has to be used with an alveolar filling material (e.g. Geistlich Bio-Oss® Collagen).
- Should be applied after de-epithelialisation of the adjoining soft-tissue margins.
- Should be adapted to the defect size and applied dry.
- Has to be applied with the spongy framework (marked with grooves) facing towards the extraction socket.
- Should be sutured with non-resorbable suture and not glued.
- Should be sutured with single-interrupted sutures (recommended: 5.0 or 6.0), double interrupted sutures or cross sutures (recommended: 5.0), depending on the defect.
- Should be tension-free and closely adapted to the de-epithelialised marginal soft-tissue border.

## Product range

### Geistlich Bio-Oss®

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>0.25 g, 0.5 g, 1.0 g, 2.0 g (1.0 g = 2.0 cm³)</td>
</tr>
<tr>
<td>Large</td>
<td>0.5 g, 1.0 g, 2.0 g (1.0 g = 3.13 cm³)</td>
</tr>
</tbody>
</table>

The small Geistlich Bio-Oss® granules are recommended for smaller 1–2 socket defects and for contouring autologous block grafts. The large Geistlich Bio-Oss® granules enable improved regeneration over large distances and provide enough space for the ingrowing bone.

### Geistlich Bio-Oss Pen®

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Small</td>
<td>0.25 g, 0.5 g (0.5 g = 1.0 cm³)</td>
</tr>
<tr>
<td>Large</td>
<td>0.5 g (0.5 g = 1.5 cm³)</td>
</tr>
</tbody>
</table>

Geistlich Bio-Oss® granules are available in an applicator. It allows the bone substitute material to be applied faster and more precisely to the surgical site. Geistlich Bio-Oss Pen® is available containing both the small granules and the large granules.

### Geistlich Bio-Oss® Collagen

Geistlich Bio-Oss® (small granules) + 10% collagen (porcine)

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 mg</td>
<td>(2.5 x 5.0 x 7.5 mm)</td>
</tr>
<tr>
<td>100 mg</td>
<td>(5.0 x 5.0 x 7.0 mm)</td>
</tr>
<tr>
<td>250 mg</td>
<td>(7.0 x 7.0 x 7.0 mm)</td>
</tr>
<tr>
<td>500 mg</td>
<td>(10.0 x 10.0 x 7.0 mm)</td>
</tr>
</tbody>
</table>

Geistlich Bio-Oss® Collagen is recommended for use in periodontal defects and extraction sockets. Through the addition of collagen, Geistlich Bio-Oss® Collagen can be tailored to the morphology of the defect and is particularly easy to apply.

### Geistlich Bio-Gide®

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 x 25 mm</td>
<td>Bilayer collagen membrane</td>
</tr>
<tr>
<td>30 x 40 mm</td>
<td></td>
</tr>
<tr>
<td>13 x 25 mm</td>
<td></td>
</tr>
</tbody>
</table>

Geistlich Bio-Gide® stabilizes the grafted area and protects bone particles from dislocation for optimal bone regeneration. The natural collagen structure allows homogeneous vascularization, supports tissue integration and wound stabilization. The combination of flexibility, good adhesion, and tear resistance contribute to easy handling, in turn saving time, and simplifying the surgical procedure.

### Geistlich Bio-Gide® Shape

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>14 x 24 mm</td>
<td>New shape specifically designed for ridge preservation and minimally invasive procedures. Geistlich Bio-Gide® Shape is pre-cut for easy handling, reduced preparation time and application comfort.</td>
</tr>
</tbody>
</table>

### Geistlich Combi-Kit Collagen

Geistlich Bio-Oss® Collagen 100 mg + Geistlich Bio-Gide® 16 x 22 mm

When used in combination, the system has optimised properties for Ridge Preservation and minor bone augmentations according to the GBR principle.

### Geistlich Mucograft® Seal

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 mm, 12 mm diameter</td>
<td>Collagen matrix</td>
</tr>
</tbody>
</table>

Geistlich Mucograft® Seal consists of a compact structure that gives stability while allowing open healing, and a spongy structure that supports blood clot stabilisation and ingrowth of soft-tissue cells.

Your Worldwide No. 1 Reference12,13,21–25

Geistlich Biomaterials is constantly working to offer you solutions for easy, predictable and successful management and regeneration of extraction sockets. The company’s own research departments along with global experts develop the product portfolio, and try new techniques and applications for existing products. In more than 15 worldwide Round Table Meetings26, expert clinicians and Geistlich Biomaterials cooperate on the aim of promoting discussion and evolving a consensus on the treatment concepts for extraction sockets. These Round Table Meetings help to define what is the current published clinical evidence and where research still needs to be done.

Unique Biofunctionality26,27

The excellent results of Ridge Preservation with Geistlich Biomaterials are largely due to their unsurpassed bio-functionality. Geistlich Bio-Oss® with its porous structure serves as guide rail for the in-growing blood vessels and integrates into newly formed bone, while the unique bilayer Geistlich Bio-Gide® preserves up to 93 % of the ridge width and may enhance early wound healing. Geistlich Bio-Oss® Collagen combined with Geistlich Bio-Gide® preserves up to 93 % of the ridge width and may enhance new bone formation vs. no membrane.

Clinically relevant

› Geistlich Biomaterials are perfectly suited to combined use for treatment of extraction sockets
› Geistlich Bio-Oss® Collagen combined with Geistlich Bio-Gide® preserves up to 93 % of the ridge width and they promote more new bone formation vs. no membrane
› Geistlich Bio-Oss® Collagen combined with Geistlich Mucograft® Seal increases preserved bone volume when compared to spontaneous healing.

Quality and safety are high priorities at Geistlich Pharma. At Geistlich Pharma everything is done under one roof: from the selection and control of the raw material to production and storage until dispatch, and all steps are taken seamlessly and meet the company’s high standards of quality and safety.
